

Early R-354
film punch
Country of origin:
Russia

DATA SUMMARY

Design/Manufacturer: Unknown.
Year of Introduction: Mid 1960s.
Purpose: Hand operated punch for integrated high speed keyer of the R-354.
Base material: Sliced 35mm photographic film.
Size (mm): Height 29, length 90, width 90.

REMARKS

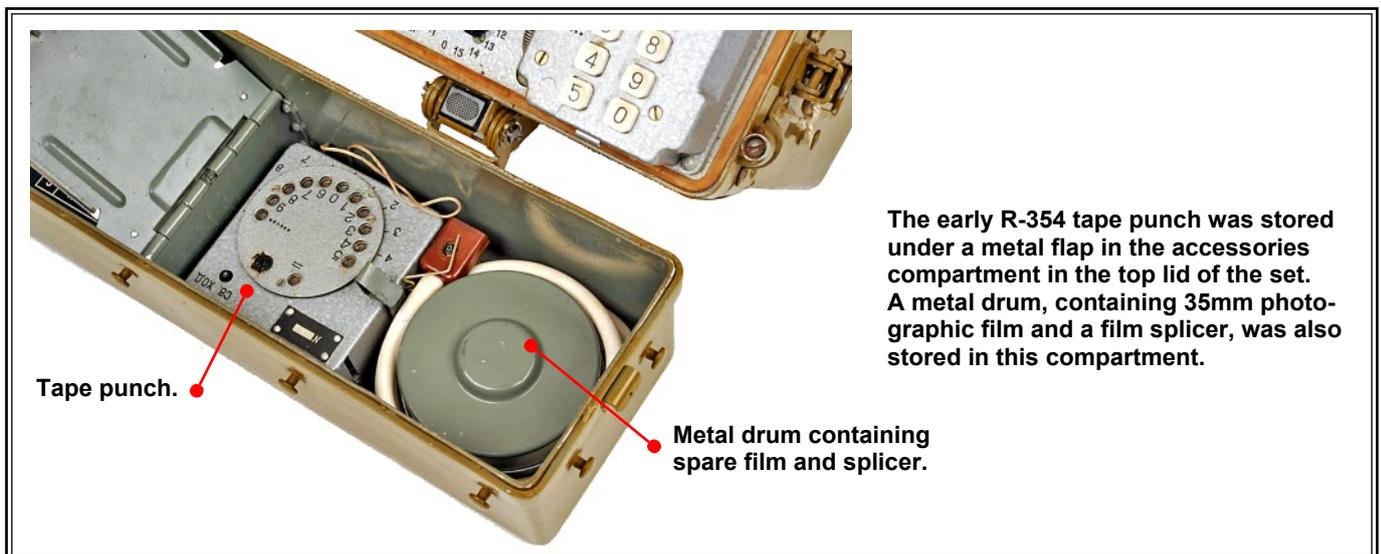

The film punch described in this chapter was issued with the R-354, code name Shmel (Russian: Шмель = Bumblebee), a Russian special forces and agents radio communication set. *). It was used to punch a series of holes into a sliced 35mm photo film to produce a coded message to be used in combination with the integrated high speed keyer of the R-354.

Before using the photographic film in the punch, it had to be sliced by a film slicer. This tool was part of the station and carried in a metal drum along with the film in the top lid of the R-354. A later issued film punch was much smaller and easier to operate.

*) See the R-354 section in the USSR chapter of WftW Volume 4.

Tape punch.

Metal drum containing spare film and splicer.

The early R-354 tape punch was stored under a metal flap in the accessories compartment in the top lid of the set. A metal drum, containing 35mm photographic film and a film splicer, was also stored in this compartment.

Numbers were punched into the film using the pattern shown above.

Special forces/agents transmitter receiver R-354.

Later issued film punch.
